SAYMAN Documentation

Everything you need to build, validate, deploy and integrate with SAYMAN Blockchain — including multi-layer chains, token factories, NFTs, and DeFi primitives.

Welcome to SAYMAN Blockchain

SAYMAN is a Proof-of-Stake Layer 1 blockchain with a built-in JavaScript smart contract engine, multi-layer chain support (L1/L2/Sidechain), EVM-like token and NFT factories, a DEX, staking pools, a peer reputation system, a REST API, a CLI wallet, a browser-based JS SDK, an Android wallet, and a testnet faucet.

Phase 20 — now live: Robust archive recovery, exponential backoff back-up system, pipelined sync blocks check, merge-verification cache safety fixes, dedicated transactions explorer with rewards toggling, and clean client/faucet/sdk separations.

What works today

- **REST API** — network stats, blocks, transactions, address lookup, validators, contracts, tokens, NFTs, staking pools, broadcast, faucet, mempool, search, gas estimation, denomination guide.
- **Multi-layer** — spin up L2 rollups, sidechains, or permissioned chains via `core/chain-factory.js`.
- **Token Factory** — deploy custom fungible tokens via `contracts/token-factory.js`.
- **NFT Factory** — deploy collections and mint NFTs via `contracts/nft-factory.js`.
- **Memecoin Factory** — one-click memecoin deployment via `contracts/memecoin-factory.js`.
- **DEX** — on-chain AMM swap contract via `contracts/dex.js`.
- **Staking Pools** — delegate-and-earn pools via `contracts/staking-pool.js`.
- **Reputation** — peers earn points for contributing valid blocks; query via `GET /api/reputation/:address`.
- **CLI wallet** (`cli/sayman-cli.js`) — create/import wallet, balance, send, stake, unstake, list validators.

- **Android wallet** — Capacitor APK, see Android APK page.
- **Web wallet** — <https://sayman-wallet-manager.vercel.app/>
- **Faucet** — <https://sayman-faucet-site.vercel.app/>

Denomination — no confusion

All on-chain amounts are integers in **base units**. Divide by **100,000,000** to get SAYN. The API exposes a `GET /api/denomination` endpoint and every balance/amount field in the explorer is labeled clearly.
